Surgical Site Infections (SSIs) and the impact on healthcare

A surgical site infection is an infection that occurs after surgery in the part of the body where the surgery took place. Surgical site infections can sometimes be superficial infections involving the skin only. Other surgical site infections are more serious and can involve tissues under the skin, organs, or implanted material.*

SSI's significantly impact healthcare budgets and patient recovery times.

<p>SSIs occur in 3% of all patients having surgery</p>	<p>SSIs cost on average \$5,171 per patient</p>	<p>SSIs reduce quality of life</p>	<p>SSI Prevention is one of 8 NSQHS Standards to protect patients</p>
<p>SSIs increase the risk of morbidity & mortality</p>	<p>SSIs increase length of hospital stay by 2.5 days on average</p>	<p>SSIs increase the need for more tests and treatment</p>	<p>SSIs increase the risk of hospital readmission</p>

Bactol® 2% CHG

<p>Features: Antiseptic hand and body wash solution with 2% w/v Chlorhexidine Gluconate</p> <p>Intended use: Clinical hand wash [Procedural antiseptic hand wash (non-surgical)], Topical antiseptic wash [pre-operative patient antiseptic body wash], Patient Body Wash [Presurgical prior to surgical or invasive procedures].</p>	<p>Directions for use:</p> <p>For Antiseptic Handwashing: Deliver 5ml [2-3 pumps] onto wet hands.
